This edition of the INGR is dedicated to the memory of Earl McCune Jr., who left us tragically and too soon on 27 May 2020. Earl was a microwave/RF guru, brilliant technologist, major industry/IEEE contributor, global visionary, keen skeptic, and all around fantastic human being. He was a major contributor to the INGR's early work on energy efficiency, millimeter-wave, and hardware. He worked for a technologically advanced yet more energy efficient world, and the contents of the INGR are a tribute to that vision. Rest in peace, Earl!

Table of Contents

1.	Introduction	1
2.	Working Group Vision	2
2.1.	Scope of Working Group Effort	2
2.2.	Linkages and Stakeholders	3
3.	Today's Landscape	6
3.1.	Current State of Technology and Research	6
3.2.	Connecting the Unconnected Population using Television White Space and Community Networks	9
3.2.1.	Internet Access	9
3.2.2.	TV White Space and Community Networks	9
3.2.3.	Community Network Approach	9
4.	Future State (2030)	11
4.1.	Free Access to Internet and Digital Public Goods	12
4.2.	Smart Villages enabled by AI, Machine Learning and the Cloud	14
5.	Requirements and Technology Gaps	16
5.1.	Cost-optimized Network Architecture and Open Platform for Services and Development	17
5.1.1.	Backhaul	17
5.1.2.	Middle-mile network	18
5.2.	NLOS Backhaul Solutions, Including Long Range Wi-Fi and TV White Space to Reach Rural and Remote Areas	22
5.2.1.	Wi-Fi for long range backhaul	22
5.2.2.	Optical Fiber Backhaul	23
5.2.3.	TVWS	23
5.3.	LOS Backhaul Solutions using Microwave, High Altitude Platforms (HAPS), and Free Space Optics (FSO)	27
5.3.1.	Mesh, Including ad hoc for D2D, communication for local coverage	28
5.3.2.	Directional and MIMO for rural backhaul	28
5.3.3.	Spectrum allocation	29
5.3.4.	A CTU network slice in B5G networks to meet basic user needs at lowest cost	30
6.	Roadmap Timeline Chart	41
7.	Conclusions and Recommendations	45
7.1.	Summary of Conclusions	45
8.	Contributors	46
9.	References	47
10.	Acronyms/abbreviations	51

ABSTRACT

Connecting the Unconnected or under-connected (CTU) is the holy grail of transforming the lives of over 3 billion people around the globe with wireless Internet who are yet to experience its value in multiple ways. If this could be accomplished, its impact on the society would be enormous.

This white paper from the IEEE Future Networks CTU Working Group endeavors to highlight the need to consider the CTU requirements in 5G and B5G networks in the standardization process, in the development of the use cases, and affordable solutions. In its Vision 2030 SDG (Sustainability Development Goals) the United Nations has proclaimed access to Internet as basic human right and has said that these goals cannot be achieved without affordable access to Internet by everyone on this planet.

While there are numerous projects and initiatives ongoing around the world, these are fragmented and lack the critical mass and coordination to be able to impact the future standards, product development, and cost of deployment otherwise achievable by volume. It is the goal of the CTU group to create an open platform where the experts can bring their ideas, solutions, and potentially collaborate to create large global projects and influence the network service providers, manufacturers and their governments. This white paper defines the CTU working group's charter, scope, and provides a brief overview of the relevant stakeholders and linkages between them. Then the paper goes into the current status of the CTU landscape and where we want to reach to accomplish the vision of connecting everybody, especially those living in rural and remote areas. We present the various standards and industry fora and how they are interlinked. While technologies are available today, they need to be customized and optimized at the systems level to bring down the cost of the network in order to be affordable. In addition, the content needs to be relevant and in local languages to be useful, not to mention the need to offer innovative human computer interaction (HCI) solutions (that are not text based) so that people who are not literate or are digitally disadvantaged can easily use the devices and consume services. Another important area is that of flexible spectrum allocation regime at the lower range of the spectrum to increase reach and coverage. Use of renewable energy sources will enable deployment in remote areas where there is lack of power grid, or it is intermittent. Thus, this white paper identifies a number of technology gaps to be filled in by 5G and B5G networks, such that access is affordable and content and services are actually consumed by the targeted set of users. Technology aside, the need to develop innovative business models is a must to be commercially sustainable in the long-term. A number of such models, especially designed for the rural population, are proposed, such as Village Level Entrepreneur (VLE) Freemium (Free + Premium), revenue sharing among the chain of service providers, subsidized billing by USOF (Universal Service Obligation Funds). Finally, the white paper presents a 10-year roadmap starting from the current state to 3 years, 5 years and 10 years.

Key words:

Digital Divide, 5G, B5G, CTU, SDG, IEEE Future Networks, Rural and remote connectivity, United Nations, Societal impact of ICT, Network slicing, Spectrum management, content management, Business models, TV white space, Satellite, Community networks, VLE, InfoInternet, Internet Lite, Business models.
